Jay CVS

Project Status Report

Website, jobs board, admin system and AI features: what's built, what's left, the decisions needed and the plan to go live.

Date	Stage	Next
4 October 2026	Design preview (front end only)	Pitch polish → real build (Next.js)

Prepared by the developer for internal planning. Contains pricing and AI cost assumptions: not for sharing with the client as-is.

1 At a glance

24	0	7	4
pages built (website, admin, developer)	script errors found in the health check	decisions waiting on you / Jay	build phases to go live

> **In one line:** the whole system is designed and clickable as a preview. Nothing is stored, paid or sent for real yet. The data lives only in the browser that opens it. What remains is real content from Jay, a few missing pages, and the real build.

2 Health check

Every page was loaded in a browser and checked automatically.

CHECK	RESULT	NOTES
Script errors on all 24 pages	**None**	Website, admin and developer pages all load cleanly.
Old (blue) colours left	**None**	Everything is on the black / cream / gold brand, including the sample CVs.
Broken links between pages	**None**	Except the two missing files below.
Missing files	**2**	`img/favicon.png` (browser tab icon) and `img/logo.svg` are referenced but don't exist.
Placeholders visible to visitors	**Yes**	Stats ("[2,000+] clients", "[4.9/5]"), "[48 hours]", "[Office address]", footer links "[About us]" / "[Privacy policy]", blog author and dates, some sample salaries.
Developer cost page on a laptop screen	**Minor**	A wide table causes a small sideways scroll.

3 What's built (design preview)

AREA	WHAT'S THERE
Public website	Home, Services, How it works, Pricing, Samples, Blog and article, the order card (choose service → upload CV → private tracking link → pay with Paystack test checkout).
Jobs board	Find a job page with filters, single job pages, homepage "Latest jobs", "Is your CV ready?" prompts.
Client tracking page	Order progress, pay, **Preview draft** in the page (watermarked), "I'm happy" / "Request changes", view final Word and PDF, leave a review.
Admin: orders	Orders list with quick filters, order page (accept, upload draft, revisions, complete), **View** files in the page, WhatsApp message templates, AI assistant, paid-but-not-accepted orders in red.
Admin: jobs	Jobs list, Post a job (read one poster with AI), **Jobs inbox** (bulk posters → AI reads → scam / duplicate / deadline flags → approve → WhatsApp channel post).
Admin: Jay only	**Team** (invite writers, permissions, pay %, pause / remove), **Finance** (takings, Paystack fees, writer pay, payouts, CSV), **Website content** (prices, reviews, samples, tips, FAQs, homepage, settings), owner dashboard with "This month" money strip.
Roles	Jay (owner and senior writer) sees money and controls everything; writers accept orders and work only on their own; they see no money. Breadcrumb navigation. AI shown to Jay as a **token balance** (1,000,000 starter tokens), never as money.
Demos	Order flow demo: team and client side by side, or **Jay vs a writer** on the same screen.
Developer only	AI cost console, AI feature plan (16 features), tokens explainer (Markdown), this report.

4 What's still missing from the preview

Content only Jay can provide

1. **Real prices** and turnaround times (the site shows example prices: KES 1,500 / 3,000 / 6,000).
2. **Real stats** (clients served, rating), or remove those badges.
3. **Office address**, social media links, and the **WhatsApp channel invite link**.
4. **Blog articles** and the author name.
5. **Real client reviews**, with permission to show them.

Pages that don't exist yet

6. **About us**, **Privacy policy** and **Terms**. The privacy policy matters: the site collects CVs, which are personal data under Kenya's Data Protection Act.
7. A **404 "page not found"** page, the **logo** file and the **favicon**.

Features discussed but not built

#	FEATURE	WHY IT MATTERS
8	**"Clients & tokens"** developer page	See every client's token balance and usage; add tokens after they pay.
9	**Token top-ups paid by M-Pesa** to the developer	Clients buy more AI tokens themselves; credits added automatically.
10	**Alerts** (WhatsApp / email)	Writers hear about new paid orders, Jay hears about red orders, clients hear when a draft is ready. Today the team must open the admin to see them.
11	**Jobs board extras**	Google for Jobs listing, "Tailor my CV for this job", saved jobs, "Report this job", "Get jobs like this on WhatsApp".
12	**Self-service CV builder tier** (CareerGo-style)	A cheap DIY option paid by short M-Pesa passes, with an upgrade to a human writer. Waiting for your go-ahead.
13	**System-wide activity log** for Jay	Who changed what and when, across everything. Orders already keep their own history.

5 Decisions waiting on you / Jay

#	DECISION	NOTES
1	Should **Executive orders go straight to Jay**?	The package now says "Written personally by Jay", but orders are still open to all writers.
2	**Writer pay model**	% of order price (40% / 35% are placeholders), fixed amount per CV, or salary.
3	**How long to keep client CVs**	The setting exists (3 / 6 / 12 / 24 months); Jay picks.
4	**Your deal with Jay**	KES 5,000 monthly maintenance fee, 1M starter tokens, top-up prices, and who pays hosting.
5	**AI features at launch**	The AI feature plan has a ready "Launch set" (8 features, ≈ KES 1,100 a month on Claude Haiku).
6	**WhatsApp number** for the live site	And whether writers ever message clients from their own phones.
7	**AI model choice**	Test Claude Haiku vs Gemini Flash-Lite on 20 real posters; the cheaper one roughly quarters poster-reading cost.

6 The real build (Next.js)

This turns the preview into a working system. Everything below is designed already; it needs a server, a database and real connections.

#	PIECE	WHAT IT INVOLVES
1	**Database**	Jobs, orders, order history, files, team and roles, website content, AI token usage, payouts.
2	**Real logins**	Jay and each writer with their own password and permissions; invites become real links.
3	**Private file storage**	CVs and drafts opened only through short-lived private links (as the viewer already describes).
4	**Paystack, live**	Checkout (M-Pesa prompt or card) and automatic confirmation when money arrives (webhook).
5	**AI connection**	Through the developer's server and key, counting tokens per client. **Built to serve several clients from day one**: the SaaS plan.
6	**Messages**	WhatsApp (start with ready-to-send links; WhatsApp Business API later) and email.
7	**Google & SEO**	Every job as its own page, sitemap, "Google for Jobs" markup.
8	**Hosting, domain, backups**	Move jaycvs.co.ke to the new site without losing Google ranking; daily backups.
9	**Data protection**	Privacy notice, consent on upload, automatic deletion after the retention period. Check whether Jay CVS must **register with the Data Protection Commissioner (ODPC)**.

Suggested build order

1. **Public site + jobs board**: quickest win; brings in traffic from Google and the WhatsApp channel.
2. **Orders, Paystack, tracking links and logins**: where the money starts.
3. **AI**: poster reading, CV tools, and the developer's token system.
4. **Team, Finance, alerts** and the extras.

7 AI and the developer's business model

> The developer runs the AI on **one account of their own** and resells it to clients as **token balances**. Jay starts with **1,000,000 tokens**, sees only tokens (never money), and asks the developer for more when they run low.

ITEM	FIGURE
Tokens Jay CVS uses in a normal month (1,200 posters + 120 orders)	≈ 3.6 million
How long 1M starter tokens last	≈ 450 posters ≈ 8 days
AI cost of a normal month to the developer (Claude Haiku 4.5)	≈ KES 840 ($6.50)
Same month with Gemini Flash-Lite for posters	≈ KES 60–250
Monthly maintenance fee (proposed)	KES 5,000
Example top-ups	KES 500 = 1M tokens · KES 2,000 = 5M tokens
Paying the AI provider	Prepaid with auto-reload (Anthropic, OpenAI); postpaid via Google Cloud or AWS / Azure

Prices are those researched for this project in 2026 at KES 130 = $1. Check the providers' pricing pages before quoting.

8 Before pitching Jay

- **Put the preview online** on a private link (e.g. a free static host) so Jay can click through on his phone.
- **Fix the quick things:** logo and favicon; replace the visible "[...]" placeholders with sensible example text or hide them.
- **Leave out the developer pages**: they're for you, not the client.

10-minute walkthrough

1. A client chooses a package, uploads their CV, gets a private tracking link and pays.
2. The order shows in red as "Not accepted"; a writer accepts it.
3. The writer uses the AI assistant, uploads a draft; the client previews it and requests a change.
4. Jay's dashboard: the money this month, the team, the token balance.
5. Jobs inbox: drop 8 posters, see the scam and duplicate caught, approve, copy the WhatsApp channel post.
6. Jay vs a writer: same order, two views. Only Jay sees money and team controls.

9 Recommended next steps

1. **Pitch polish** (about one session): placeholders, logo and favicon, developer page scroll, walkthrough script.
2. **Put the preview online** on a private link for Jay.
3. **After Jay says yes:** settle the 7 decisions in section 5, then start the Next.js build at phase 1.
